

Convert to FLAC is a BASH shell script, and was originally written for use under Linux. It should, however, run under any OS that supports BASH.

Convert to FLAC currently supports the following input formats:

- [Apple Lossless \(ALAC\)](#) - requires [alac](#) and [mp4info](#) (for metadata) binaries
- [FLAC](#) (eg., for transcoding to a different compression ratio)
- [Meridian Lossless Packing \(MLP\)](#) - commonly found on DVD-Audio and Blu-ray discs; requires [ffmpeg](#)
- [Monkey's Audio \(APE\)](#) - requires [mac](#) and [apeinfo](#) (for metadata) binaries
- [Shorten](#) - requires [shorten](#) binary
- [True Audio \(TTA\)](#) - requires [ttaenc](#) binary
- [WAVE](#)
- [WavPack](#) - requires [wvunpack](#) binary
- [Windows Media Audio Lossless \(WMA\)](#) - requires [ffmpeg](#)

You can find the script on [LegRoom.net](#) and [GitHub](#).
